Ad Hoc Testing Interview Questions and Answers

1. What is Ad Hoc Testing?

Ad Hoc Testing is an informal and unstructured software testing type performed without planning and documentation. It aims to find defects by random checking.

2. When is Ad Hoc Testing performed?

It is usually performed after the formal testing is completed and before the product release. It is done when there's limited time.

3. Is Ad Hoc Testing effective?

Yes, it can be very effective in finding unexpected bugs that structured testing may miss, especially when done by experienced testers.

4. What skills are important for Ad Hoc Testing?

Good domain knowledge, experience with the application, creativity, and intuition help testers uncover issues through Ad Hoc Testing.

5. What are Monkey Testing and how is it related to Ad Hoc Testing?

Monkey Testing is a type of Ad Hoc Testing where the tester inputs random data or performs random actions to see if the system crashes.

6. What tools can support Ad Hoc Testing?

Although Ad Hoc Testing is mostly manual, tools like log analyzers, debuggers, and screen recording tools can assist the process.

Log analyzers help uncover what the system did wrong.

Debuggers help trace the source of the issue.

Screen recorders help document what you did

7. Can Ad Hoc Testing be documented?

Ad Hoc Testing Interview Questions and Answers

While it typically isn't, testers can log defects found during Ad Hoc Testing to help improve future test planning and coverage.
